

Section 2: Circles

Notes and Examples

These notes and examples contain subsections on

- [The equation of a circle](#)
- [Finding the equation of a circle](#)
- [The intersection of a line and a circle](#)
- [Circle geometry](#)

The equation of a circle

You should know about the following results, which you need to learn:

The general equation of a circle, centre the origin and radius r is

$$x^2 + y^2 = r^2$$

The general equation of a circle, centre (a, b) and radius r is

$$(x-a)^2 + (y-b)^2 = r^2$$

Make sure you understand why these equations describe circles.

Notice that the circle $(x-a)^2 + (y-b)^2 = r^2$ is just a translation of the circle $x^2 + y^2 = r^2$. The centre of the circle has moved from the point $(0, 0)$ to the point (a, b) . So the circle $x^2 + y^2 = r^2$ has been translated through the vector $\begin{pmatrix} a \\ b \end{pmatrix}$.

Example 1

For each of the following circles find (i) the coordinates of the centre and (ii) the radius.

(a) $x^2 + y^2 = 49$

(b) $(x+2)^2 + (y-6)^2 = 9$

Describe the transformation that maps the circle $(x+2)^2 + (y-6)^2 = 9$ to the circle $x^2 + y^2 = 9$

Solution

- (a) $x^2 + y^2 = 49$ can be written as $x^2 + y^2 = 7^2$.
- (i) The coordinates of the centre are $(0, 0)$
 - (ii) The radius is 7.

This is a particular case of the general form $x^2 + y^2 = r^2$ which has centre $(0, 0)$ and radius r .

AQA FM Coordinate geometry 2 Notes & Examples

(b) $(x + 2)^2 + (y - 6)^2 = 9$ can be written as $(x - (-2))^2 + (y - 6)^2 = 3^2$.

- (i) The coordinates of the centre are $(-2, 6)$
- (ii) The radius is 3.

A translation of $\begin{pmatrix} 2 \\ -6 \end{pmatrix}$.

This is a particular case of the general form $(x - a)^2 + (y - b)^2 = r^2$ which has centre (a, b) and radius r .

The centre of the circle is moved from $(-2, 6)$ to $(0, 0)$.

Finding the equation of a circle

You can write down the equation of a circle directly if you are given the coordinates of its centre and its radius.

Example 2

Find the equation of each of the following.

- (a) a circle, centre $(0, 0)$ and radius 4.
- (b) a circle, centre $(3, -4)$ and radius 6.

Solution

(a) The equation of a circle centre the origin is $x^2 + y^2 = r^2$

$$r = 4 \text{ so the equation is } x^2 + y^2 = 4^2 \\ \text{i.e. } x^2 + y^2 = 16$$

(b) The equation of a circle centre (a, b) and radius r is $(x - a)^2 + (y - b)^2 = r^2$

$$a = 3, b = -4 \text{ and } r = 6 \text{ so the equation is } (x - 3)^2 + (y - (-4))^2 = 6^2 \\ \text{i.e. } (x - 3)^2 + (y + 4)^2 = 36$$

The intersection of a line and a circle

The next example looks at the intersection of a line and a circle.

Example 3

Find the coordinates of the point(s) where the circle $(x + 2)^2 + (y - 1)^2 = 9$ meets

- (i) the line $y = 5$

AQA FM Coordinate geometry 2 Notes & Examples

- (ii) the line $x = 1$
- (iii) the line $y = 2 - x$

Solution

- (i) Substituting $y = 5$ into the equation of the circle:

$$(x+2)^2 + (5-1)^2 = 9$$

$$(x+2)^2 + 16 = 9$$

$$(x+2)^2 = -7$$

The expression $(x+2)^2$
cannot be negative

There are no solutions. The line does not meet the circle.

- (ii) Substituting $x = 1$ into the equation of the circle:

$$(1+2)^2 + (y-1)^2 = 9$$

$$9 + (y-1)^2 = 9$$

$$(y-1)^2 = 0$$

$$y = 1$$

The point is on the line $x = 1$,
so its x -coordinate must be 1.

The line touches the circle at $(1, 1)$.

- (iii) Substituting $y = 2 - x$ into the equation of the circle:

$$(x+2)^2 + (2-x-1)^2 = 9$$

$$(x+2)^2 + (1-x)^2 = 9$$

$$x^2 + 4x + 4 + 1 - 2x + x^2 = 9$$

$$2x^2 + 2x - 4 = 0$$

$$x^2 + x - 2 = 0$$

$$(x-1)(x+2) = 0$$

$$x = 1 \text{ or } x = -2$$

Substitute the x values into the
equation of the line to find the
 y -coordinates.

When $x = 1$, $y = 2 - 1 = 1$

When $x = -2$, $y = 2 - (-2) = 4$

The line crosses the circle at $(1, 1)$ and $(-2, 4)$.

Circle geometry

The four facts about circles given below are important. They often help to solve problems involving circles.

1. The angle in a semicircle is a right angle. In the diagram below AB is a diameter (with O the centre of the circle) and angles ADB and ACB are right angles (being subtended from the diameter to points on the circumference).

AQA FM Coordinate geometry 2 Notes & Examples

2. The perpendicular from the centre of a circle to a chord bisects the chord. In the diagram below, where O is the centre of the circle, the radius OC is perpendicular to the chord AB and it meets AB at the midpoint M of AB.

3. The tangent to a circle is perpendicular to the radius at that point. In the diagram below the line through B and D is tangent to the circle at A. The radius OA and this tangent are perpendicular.

AQA FM Coordinate geometry 2 Notes & Examples

4. Two tangents from a point to a circle are equal in length. In the diagram below the line passing through B and C is a tangent to the circle and the line passing through A and C is a tangent to the circle. The lengths BC and AC are equal.

Keep these properties in mind when dealing with problems involving circles.

Example 4

A circle is centred at the origin and goes through the point $A = (2, -1)$.
Find the equation of the tangent to the circle at A

AQA FM Coordinate geometry 2 Notes & Examples

Solution

The tangent is perpendicular to the line between the origin and A

$$\text{Gradient of OA} = \frac{-1 - 0}{2 - 0} = -\frac{1}{2}$$

$$\text{Gradient of tangent} = 2$$

To find the gradient of a perpendicular line we find the negative reciprocal

The tangent goes through (2, -1) and has gradient 2

$$y - -1 = 2(x - 2)$$

$$y + 1 = 2x - 4$$

$$y = 3x - 5$$

Example 5

D, E and F are points on a circle, DE is a diameter of the circle, D is on the y axis, E = (6,0) and F = (1, 5).

- Find the coordinates of point D.
- Find the coordinates of the centre of the circle
- Find the equation of the circle

Solution

- As DE is a diameter, angle DFE must be a right angle.

Drawing a diagram allows you to see where the right angles are and which lines are perpendicular

$$\text{Gradient of EF} = \frac{0 - 5}{6 - 1} = \frac{-5}{5} = -1$$

$$\text{Gradient of DF} = 1$$

Equation of line through DF :

$$y - 5 = 1(x - 1)$$

$$y - 5 = x - 1$$

$$y = x + 4$$

As D is on the y axis the coordinates are where this line intercepts the y axis.

This will be at (0, 4)

AQA FM Coordinate geometry 2 Notes & Examples

- (ii) The centre of the circle is the midpoint of the diameter DE.

$$\left(\frac{6+0}{2}, \frac{0+4}{2} \right) = (3, 2)$$

- (iii) The radius is the distance from the centre to any point on the edge.
For example (3, 2) to (0, 4)

$$\sqrt{(3-0)^2 + (2-4)^2}$$

$$\sqrt{(3)^2 + (-2)^2} = \sqrt{9+4} = \sqrt{13}$$

Equation of the circle: $(x-3)^2 + (y-2)^2 = 13$
